

RETAINING RINGS

Eurobelt retaining rings are used to secure the central gear on the drive and driven shafts. They are placed on both sides of the central sprocket and are part of the self-guiding system of the modular belts, preventing the sprocket from sliding along the shaft and avoiding lateral displacements of the belt.

Additionally, the effects of temperature cause the belt to expand or contract.

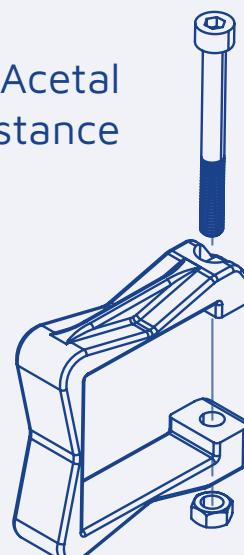

The rest of the sprockets slide freely along the shaft, allowing them to adapt to the variations and lateral movements of the belt. This ensures that the correct tooth position is maintained at all times.

The **CLU Eurobelt retainer rings** guarantee the fastening of the **Central Sprocket** on both drive and idle shafts.

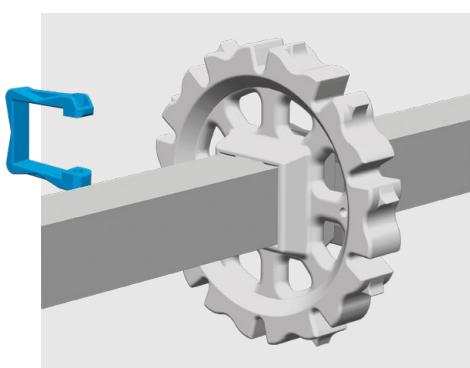

For square shaft
of 40 mm or 1 ½"

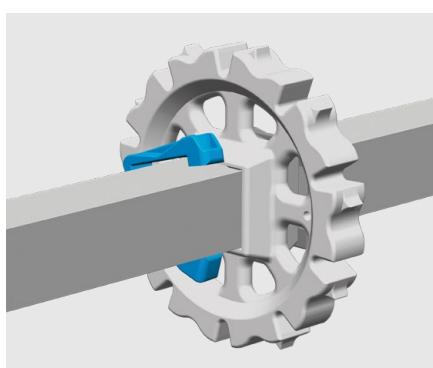

The belt can expand or contract due to the temperature.

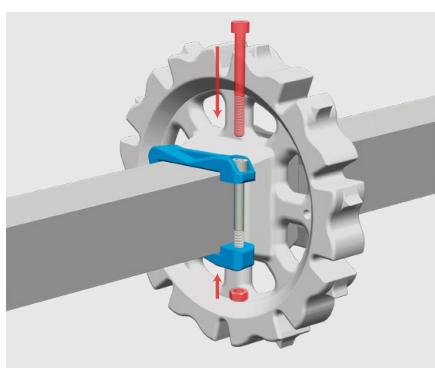

The drive system of modular belts requires the central sprocket not to move axially both in the drive and the idle shafts.

1 Direct installation without dismantling the shaft.

2 Easy placing on the shaft by opening the ring.

3 Reliable closing of the ring by means of a screw and nut at a **low cost**.
